Grades 9-12**

Dear Educator,

As we embark upon a new and exciting science journey, Pearson is committed to offering its complete support as classrooms transition to the new Next Generation Science Standards (NGSS). Ready-to-use solutions for today and a forward-thinking plan for tomorrow connect teacher education and development, curriculum content and instruction, assessment, and information and school design and improvement. We'll be here every step of the way to provide the easiest possible transition to the NGSS with a coherent, phased approach to implementation.

Pearson has long-standing relationships with contributors and authors who have been involved with the development and review of the Next Generation Science Frameworks and subsequent Next Generation Science Standards. As such, the spirit and pedagogical approach of the NGSS initiative is embedded in all of our programs, such as ***Physical Science: Concepts in Action with Earth and Space Science***.

The planning and development of Pearson's ***Physical Science: Concepts in Action*** was informed by the same foundational research as the NGSS Framework. Specifically, our development teams used Project 2061, the National Science Education Standards (1996) developed by the National Research Council, as well as the Science Anchors Project 2009 developed by the National Science Teachers Association to inform the development of this program. As a result, students make connections throughout the program to concepts that cross disciplines, practice science and engineering skills, and build on their foundational knowledge of key science ideas.

Physical Science: Concepts in Action helps students make the important connection between the science they read and what they experience every day. Relevant content, lively explorations and a wealth of hands-on activities take students' understanding of science beyond the page and into the world around them.

21st Century Skills

Each chapter in ***Physical Science*** begins with an activity geared toward developing one or more 21st century skills. All of these activities task students to capture what they are learning in biology class and apply the knowledge to solving real-life problems in order to encourage productive, thoughtful members of the 21st century world.

Virtual Physical Science

A Pearson exclusive, this is the most robust interactive lab available. A proven formula for reading success before during, and after every lesson enables students to fully understand key concepts.

The Complete Interactive Textbook

Available online and on CD-ROM. Audio of the full text read-aloud supports English language learners and reluctant readers. PresentationEXPRESS helps you create dynamic presentations with slides, videos, and participatory activities.

The following document demonstrates how ***Physical Science: Concepts in Action with Earth and Space Science, ©2011***, supports the Next Generation Science Standards (NGSS). Correlation references are to the Student Editions, Teacher Editions, and Teacher Lab Resources.

HS-PS1 Matter and Its Interactions

HS-PS1 Matter and Its Interactions

HS-PS1-1. Use the periodic table as a model to predict the relative properties of elements based on the patterns of electrons in the outermost energy level of atoms. [Clarification Statement: Examples of properties that could be predicted from patterns could include reactivity of metals, types of bonds formed, numbers of bonds formed, and reactions with oxygen.] [Assessment Boundary: Assessment is limited to main group elements. Assessment does not include quantitative understanding of ionization energy beyond relative trends.]

PHYSICAL SCIENCE, Concepts in Action: Information on the periodic table is presented in Chapter 5, The Periodic Table on SE/TE pages 124-155. The organization of the table is described in Section 5.2, The Modern Periodic Table, on SE/TE pages 130-138. In Section 5.3, Representative Groups, the relationship of the outermost electrons to the periodic table is described in Valence Electrons on SE/TE page 139 and the effect of valence electrons on the properties of elements in groups 1A through 8A are described on SE/TE pages 140-145. Chemistry Refresher, Metalloids, on TE only page 124D, discusses the metalloid area of the periodic table and the properties of metalloids. Chemistry Refresher, Diagonals, on TE only page 124D, discusses the diagonal relationships between some elements in the periodic chart and the relationship to predictions of properties of those elements

In Section 5.3 Assessment question 1, on SE/TE page 145, students **explain** why elements in a group have similar properties; in question 5, students **identify** which group of elements is least reactive; in question 6, students **explain** why hydrogen is located in a group with reactive metals; in question 12, students **generalize** about the property of reactivity in metals. In Exploration Lab: Predicting the Density of an Element, SE/TE pages 150-151 and Lab pages 289-291, students **predict** the density of germanium based on the density of silicon, tin, and lead and the periodic table. In Teacher Demo, Variation Across a Period, on TE only page 138, students **observe** differences in electrical conductivity among three period 3 elements. In Valence Electrons: Integrate Space Science, on TE only page 139, students **research** and **explain** the conditions under which hydrogen has the properties of a metal. In Use Visuals: The Alkali Metals, on TE only page 140, students **predict** the reactivity of elements within one group. In Compare/Contrast Chart, on TE only page 140, students **record** similarities and differences between group 1A and 2A. In Build Science Skills, on TE only page 159, students **predict** the electron dot diagrams for various elements based on their position in the periodic chart. In Investigation 5A, Using Clues to Identify Elements, on Lab pages 47-52, students use their knowledge about valence electrons and the periodic table to **identify** 34 elements. In Investigation 5B, Comparing Chemical Properties Within a Group, on Lab pages 53-56, students **predict** reactivity of elements in the 2A group of the periodic table.

HS-PS1-2. Construct and revise an explanation for the outcome of a simple chemical reaction based on the outermost electron states of atoms, trends in the periodic table, and knowledge of the patterns of chemical properties.

[Clarification Statement: Examples of chemical reactions could include the reaction of sodium and chlorine, of carbon and oxygen, or of carbon and hydrogen.] [Assessment Boundary: Assessment is limited to chemical reactions involving main group elements and combustion reactions.]

PHYSICAL SCIENCE, Concepts in Action: Chemical bonding is presented in Chapter 6, Chemical Bonds. Ionic bonding is introduced in Section 6.1, Ionic Bonding, on SE/TE pages 158-164. Covalent bonding content is located in Section 6.2, Covalent Bonding, on SE/TE pages 165-169. Metal bonding is introduced in Section 6.4, The Structure of Metals, SE/TE pages 176-181. Simple chemical reactions are introduced in Chapter 7, Chemical Reactions. Types of reactions are p in Section 7.2, Types of Reactions, on SE/TE pages 199-205. Patterns in the periodic table are introduced in Section 5.3, Representative Groups, on SE/TE pages 139-145. The role of electrons in chemical bonds are discussed in the Bond Strength in Ionic Compounds, Electronegativity and Bond Types, and Metallic Bonding sections of Chemistry Refresher on TE only pages 156C-156D.

In Section 6.1 Assessment question 6, on SE/TE page 164, students **explain** the outcome of reactions between elements from group 1A and group 7A in terms of valence electrons. In Connection Concepts, on SE/TE page 164, students **compare** the reactivity of potassium and calcium based on their position in the periodic chart which is based on valence electrons. In Quick Lab, Identifying a Type of Reaction, on SE/TE page 203, students **explain** a replacement reaction. In Section 7.2 Assessment question 6, on SE/TE page 205, students **explain** a redox reaction in terms of electron transfer. In Writing in Science, on SE/TE page 205, students **explain** the reaction types when water is formed from hydrogen and oxygen. Instruct, Integrate Social Studies, on TE only page 158, students **draw** valence diagrams for boron, carbon, nitrogen, oxygen, and fluorine. In Build Science Skills, on TE only page 159, students **predict** the electron dot diagrams for various elements based on their position in the periodic chart. Students **explain** the outcome of simple chemical reactions in Investigation 6B, Comparing Ionic and Molecular Compounds, on Lab pages 63-66. Students **predict** the products and **explain** the outcome of simple chemical reactions in Investigation 7A, Using Single-Replacement Reactions to Compare Reactivities, on Lab pages 67-72. Students **explain** the outcome of a synthesis reaction in Investigation 7B, Recognizing a Synthesis Reaction, on Lab pages 73-76.

Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-PS1-3. Plan and conduct an investigation to gather evidence to compare the structure of substances at the bulk scale to infer the strength of electrical forces between particles. [Clarification Statement: Emphasis is on understanding the strengths of forces between particles, not on naming specific intermolecular forces (such as dipole-dipole). Examples of particles could include ions, atoms, molecules, and networked materials (such as graphite). Examples of bulk properties of substances could include the melting point and boiling point, vapor pressure, and surface tension.] [Assessment Boundary: Assessment does not include Raoult's law calculations of vapor pressure.]

PHYSICAL SCIENCE, Concepts in Action: Electrical forces between particles are presented in Section 6.1, Ionic Bonding, on SE/TE pages 158-162 and 164, Section 6.2 Covalent Bonding, on SE/TE pages 165-169, and Section 7.4, The Structure of Metals, on SE/TE pages 176-181.

In Data Analysis, What Determines the Size of an Atom or Ion, on SE/TE page 160, students **analyze** data about atomic radii and **infer** the relationship between the number of valence electrons and atomic radius. In Connection Concepts, on SE/TE page 164, students **infer** the relative levels of the strength of electric forces in potassium and calcium atoms based on the bulk property reactivity. In Quick Lab, Analyzing Inks, on SE/TE 167 students **compare** the solubility of atoms in different inks to **compare** the strength of polar bonds. In Section 6.2 Assessment question 7, on SE/TE page 169, students **explain** the difference in boiling points for water and chlorine in terms of the strength of electrical forces. In Teacher Demo, Comparing Bond Types, on TE only page 177, students **compare** malleability of ionic and metal compounds.

HS-PS1-4. Develop a model to illustrate that the release or absorption of energy from a chemical reaction system depends upon the changes in total bond energy. [Clarification Statement: Emphasis is on the idea that a chemical reaction is a system that affects the energy change. Examples of models could include molecular-level drawings and diagrams of reactions, graphs showing the relative energies of reactants and products, and representations showing energy is conserved.] [Assessment Boundary: Assessment does not include calculating the total bond energy changes during a chemical reaction from the bond energies of reactants and products.]

PHYSICAL SCIENCE, Concepts in Action: Energy in chemical reactions is presented in Section 7.3, Energy Changes in Reactions, on SE/TE pages 206-209.

In figure 17, on SE/TE page 207, students **model** the release of energy from the combustion of propane. In figure 18, on SE/TE page 208, students **use** graphs to model the release of energy in exothermic reactions and the absorption of energy in endothermic reactions. In Teacher Lab, Exothermic Reaction, on TE only page 200, students **observe** the release of energy during a chemical reaction. In Build Science Skills, Chemical Bonds and Energy, on TE only page 206, students **model** the energy in a molecule of propane using ball-and-stick models.

HS-PS1-5. Apply scientific principles and evidence to provide an explanation about the effects of changing the temperature or concentration of the reacting particles on the rate at which a reaction occurs. [Clarification Statement: Emphasis is on student reasoning that focuses on the number and energy of collisions between molecules.] [Assessment Boundary: Assessment is limited to simple reactions in which there are only two reactants; evidence from temperature, concentration, and rate data; and qualitative relationships between rate and temperature.]

PHYSICAL SCIENCE, Concepts in Action: Energy change in chemical reactions is presented in Section 7.3, Energy Changes in Reactions, on SE/TE pages 206-209. Factors affecting reaction rates are covered in Section 7.4, Reaction Rates, on SE/TE pages 212-215.

In figure 21, on SE/TE page 213, students **explain** how surface area affects reaction rates in a reaction between grain dust and oxygen. In Quick Lab, Observing the Action of Catalysts, on SE/TE page 214, students **describe** how a catalyst is able to promote a chemical reaction. In Writing in Science, on SE/TE page 215, students **write** a paragraph **explaining** how temperature, concentration, surface area, and catalysts affect reaction rates. In Section 7.4 Assessment question 3, on SE/TE page 215, students **explain** why reactions take place faster at higher temperatures.; in question 4, students **predict** the effect of dilution on a chemical reaction; in question 5, students **explain** how a catalyst makes a reaction go faster; in question 6, students **predict** the effect of a catalyst on a chemical reaction. In Teacher Demo, Temperature and Rate, on TE only page 213, students **observe** the effect of temperature on reaction rate.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-PS1-6. Refine the design of a chemical system by specifying a change in conditions that would produce increased amounts of products at equilibrium.* [Clarification Statement: Emphasis is on the application of Le Chatlier's Principle and on refining designs of chemical reaction systems, including descriptions of the connection between changes made at the macroscopic level and what happens at the molecular level. Examples of designs could include different ways to increase product formation including adding reactants or removing products.] [Assessment Boundary: Assessment is limited to specifying the change in only one variable at a time. Assessment does not include calculating equilibrium constants and concentrations.]

PHYSICAL SCIENCE, Concepts in Action: Equilibrium in chemical reactions is covered in Section 7.5, Equilibrium, on SE/TE pages 216-219.

In figure 25, on SE/TE page 217, students **model** equilibrium between aqueous and gaseous water. In Problem Solving Activity, Recreating High Altitudes, on SE/TE page 218, students change the density of oxygen in a closed space to **model** equilibrium between hemoglobin and oxygen at high altitudes. In Section 7.5 Assessment question 5, on SE/TE page 219, students **infer** how the increase in pressure on a reaction will alter the equilibrium for that reaction. In Design Your Own Lab, Manipulating Chemical Equilibrium, on SE/TE pages 220-221 and Lab pages 295-297, students **change** conditions in an experiment to alter the equilibrium of a chemical reaction. In Build Science Skills, Types of Equilibria, on TE only page 216, students **model** chemical equilibrium.

HS-PS1-7. Use mathematical representations to support the claim that atoms, and therefore mass, are conserved during a chemical reaction. [Clarification Statement: Emphasis is on using mathematical ideas to communicate the proportional relationships between masses of atoms in the reactants and the products, and the translation of these relationships to the macroscopic scale using the mole as the conversion from the atomic to the macroscopic scale. Emphasis is on assessing students' use of mathematical thinking and not on memorization and rote application of problem-solving techniques.] [Assessment Boundary: Assessment does not include complex chemical reactions.]

PHYSICAL SCIENCE, Concepts in Action: Mathematical representations of chemical reactions are presented in Section 7.1, Describing Reactions, on SE/TE pages 192-198. Conservation of mass is introduced on SE/TE page 193.

In Figure 2, Burning Carbon, on SE/TE page 193, students **explain** how models of chemical reactions show conservation of mass. In Figure 4, on SE/TE page 194, students **explain** how balanced chemical equations show conservation of mass. In Math Practice, on SE/TE page 195, students **use** mathematical expressions to show conservation of mass. In Use Visuals, Balancing Equations, on TE only page 194, students **use** models to **create** mathematical representations of balanced reactions. In Additional Problems, on TE only page 195, students **use** mathematical representations to **show** conservation of mass. In Investigation 7A, Using Single-Replacement Reactions to compare Reactivities, Analysis questions 6 and 8 on Lab pages 71-72 and the Go Further section on Lab page 72, students **use** mathematical representations to show the conservation of mass. In Investigation 7B, Recognizing a Synthesis Reaction on Lab, Analysis, question 7 on page 76, students **use** mathematical representations to show the conservation of mass in a reaction between copper and oxygen.

HS-PS1-8. Develop models to illustrate the changes in the composition of the nucleus of the atom and the energy released during the processes of fission, fusion, and radioactive decay. [Clarification Statement: Emphasis is on simple qualitative models, such as pictures or diagrams, and on the scale of energy released in nuclear processes relative to other kinds of transformations.] [Assessment Boundary: Assessment does not include quantitative calculation of energy released. Assessment is limited to alpha, beta, and gamma radioactive decays.]

PHYSICAL SCIENCE, Concepts in Action: Radioactive decay is introduced in Section 10.1, Radioactivity and 10.2, Rates of Nuclear Decay, on SE/TE pages 292-301. Changes in the nucleus through transmutation are introduced in Section 10.3, Artificial Transmutation, on SE/TE pages 303-305. Fission and fusion are introduced in Section 10.4, Fission and Fusion, on SE/TE pages 309-311 and 315.

In Math Practice on SE/TE page 295, students **use a mathematical model** of radioactive decay to balance equations for nuclear decay. In Section 10.1 Assessment question 8, on SE/TE page 297, students **use a model** of nuclear decay to **predict** the effect of beta decay on the composition of a nucleus. In Math Practice, on SE/TE page 297, students **use a mathematical model** of radioactive decay to balance equations for nuclear decay. In Quick Lab Modeling Transmutation, on SE/TE page 304, students **model** changes during transmutation in the nuclei of boron and of nitrogen. In Section 10.3 Assessment question 4, on SE/TE page 305, students **model** the transmutation of oxygen to fluorine; in question 7, students **model** the transmutation of plutonium to curium. In Figure 15, on SE/TE page 308, students **use models** of nuclear and electric forces in the nucleus. In Figure 16, on SE/TE page 30, students **use models** of electric forces in the nucleus. In figure 19, on SE/TE page 311, students **use a model** of nuclear fission to **explain** the isotope formation from uranium 235. In Exploration Lab, Modeling a Chain Reaction, on SE/TE pages 316-317 and Lab pages 305-308, students **model** a nuclear fission chain reaction. In Additional Problems, on TE only page 295, students **use a mathematical model** of radioactive decay to **balance** equations for nuclear decay. In Teacher Demo, Nuclear Process, on TE only page 311, students **observe** a model of nuclear fission and fusion. In Investigation 10A, Modeling Radioactive Decay, on Lab pages 101-106, students **model** radioactive decay.

HS-PS2 Motion and Stability: Forces and Interactions

HS-PS2 Motion and Stability: Forces and Interactions

Students who demonstrate understanding can:

HS-PS2-1. Analyze data to support the claim that Newton's second law of motion describes the mathematical relationship among the net force on a macroscopic object, its mass, and its acceleration. [Clarification Statement: Examples of data could include tables or graphs of position or velocity as a function of time for objects subject to a net unbalanced force, such as a falling object, an object rolling down a ramp, or a moving object being pulled by a constant force.] [Assessment Boundary: Assessment is limited to one-dimensional motion and to macroscopic objects moving at non-relativistic speeds.]

PHYSICAL SCIENCE, Concepts in Action: Newton's Second Law is introduced in Newton's Second Law of Motion, on SE/TE pages 365 and 368. Applications of Newton's Second Law is discussed in Crash-Test Dummies, on SE/TE page 366 and in Facts and Figures, Bike Helmets, on TE only page 366. Mathematical representations of Newton's Second Law are introduced in Math Skills and Math Practice, on SE/TE page 367 and in Additional Problems, on TE only page 367.

In Quick Lab, Investigating Inertia, on SE/TE page 365, students **observe** the proportional relationship between force and inertia. Students **solve** mathematical problems that describe net force, mass, and acceleration in Math Practice, on SE/TE page 367, and in Additional Problems, on TE only page 367. In Math Practice, on SE/TE page 369, students **calculate** deceleration and net force using Newton's Second Law. In Exploration Lab, Investigating a Balloon Jet, on SE/TE page 383 and Lab pages 311-312, students **analyze data** from a balloon jet experiment using support from Newton's Second Law. In Teacher Demo, Force and Acceleration, on TE only page 365, students **observe** that acceleration is directly proportional to force applied. In Investigation 12A, Using a Pendulum to Measure the Acceleration Due to Force of Gravity, on Lab pages 123-128, students **use** Newton's Second Law to **determine** the value of acceleration due to gravity. In Investigation 12B, Testing Galileo's Hypothesis, on Lab pages 129-132, students use Newton's Second Law to **test** Galileo's Hypothesis that freely falling objects fall at a constant rate.

HS-PS2-2. Use mathematical representations to support the claim that the total momentum of a system of objects is conserved when there is no net force on the system. [Clarification Statement: Emphasis is on the quantitative conservation of momentum in interactions and the qualitative meaning of this principle.] [Assessment Boundary: Assessment is limited to systems of two macroscopic bodies moving in one dimension.]

PHYSICAL SCIENCE, Concepts in Action: Conservation of momentum is discussed in Conservation of Momentum, on SE/TE pages 376-377.

In figure 17, on SE/TE page 376, students **analyze** data from collisions to show that the total momentum of the system does not change. In Data Analysis, Momentum, on SE/TE page 377, students **analyze** data in a graph that shows that momentum is conserved. In Section 12.3 Assessment question 3, on SE/TE page 377, students **describe** the necessary conditions for conservation of momentum.

HS-PS2-3. Apply scientific and engineering ideas to design, evaluate, and refine a device that minimizes the force on a macroscopic object during a collision.* [Clarification Statement: Examples of evaluation and refinement could include determining the success of the device at protecting an object from damage and modifying the design to improve it. Examples of a device could include a football helmet or a parachute.] [Assessment Boundary: Assessment is limited to qualitative evaluations and/or algebraic manipulations.]

PHYSICAL SCIENCE, Concepts in Action: Newton's Second Law is introduced on SE/TE pages 365 and 368. Applications of Newton's Second Law is discussed in Crash-Test Dummies, on SE/TE page 366, and in Facts and Figures, Bike Helmets, on TE only page 366. Mathematical representations of Newton's Second Law are introduced in Math Skills and Math Practice, on SE/TE page 367, and in Additional Problems, on TE only page 367. In Concepts in Action, on SE/TE pages 370-371, parachutes and terminal velocity are explained. Newton's Third Law is introduced on SE/TE pages 373. Conservation of momentum is discussed in Conservation of Momentum, on SE/TE pages 376-377.

In Figure 12, on SE/TE pages 364-365, students **analyze** the functioning of air bags in automobiles that are used to minimize the force on a body during an accident. In Build Science Skills, on TE only page 370, students **evaluate** a model of a parachute.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-PS2-4. Use mathematical representations of Newton's Law of Gravitation and Coulomb's Law to describe and predict the gravitational and electrostatic forces between objects. [Clarification Statement: Emphasis is on both quantitative and conceptual descriptions of gravitational and electric fields.] [Assessment Boundary: Assessment is limited to systems with two objects.]

PHYSICAL SCIENCE, Concepts in Action: Universal forces are introduced in Section 12.4, Universal Forces, on SE/TE pages 378-382. Electromagnetic forces are discussed on SE/TE pages 378-379. Gravitational forces are discussed on SE/TE pages 380-382. Newton's law of universal gravitation is defined on SE/TE page 380. Electric force is further discussed in Section 20.1, Electric Charge and Static Electricity, on SE/TE pages 600-603. Coulomb's law is defined on SE/TE page 601. In Facts and Figures, Electrical Force and Gravitational Force, on TE only page 602, the strength of electric and gravitational forces in a nucleus of an atom are calculated and compared.

In Quick Lab, Investigating Force and Distance, on SE/TE page 380, students **describe** how the force of electrostatic attraction is affected by distance. In Figure 21, on SE/TE page 380, students **use models** of the mathematical relationships in Newton's law of universal gravitation. In Figure 3, on SE/TE page 601, students **use models** of the mathematical relationships in Coulomb's law. In Section 20.1 Assessment question 6, on SE/TE page 603, students **explain** how electric force depends on the amount of charge and the distance between charges. In Teacher Demo, Electric Attraction and Repulsion, on TE only page 601, students **observe** electric forces.

HS-PS2-5. Plan and conduct an investigation to provide evidence that an electric current can produce a magnetic field and that a changing magnetic field can produce an electric current. [Assessment Boundary: Assessment is limited to designing and conducting investigations with provided materials and tools.]

PHYSICAL SCIENCE, Concepts in Action: Electric current is defined and described on SE/TE page 604. Magnetic field is defined and described on SE/TE page 631. Electromagnetism is introduced in Section 21.2, Electromagnetism, on SE/TE pages 635-639.

In Quick Lab, Making an Electromagnet, on SE/TE page 637, students **produce** a magnetic field using an electric current. In Application Lab, Investigating an Electric Generator, on SE/TE pages 648-649 and Lab pages 333-334, students **build** an electric generator using magnets. In Teacher Demo, Magnetic Field from Electric Current, on TE only page 636, students **observe** how an electric current produces a magnetic field. In Teacher Demo, Electromagnetic Force, on TE only page 638, students **observe** the magnetic force exerted on a wire carrying an electric current. In Investigation 21A, Studying Electromagnetic Induction, on Lab pages 221-225, students **investigate** inducing a current using a bar magnet.

HS-PS2-6. Communicate scientific and technical information about why the molecular-level structure is important in the functioning of designed materials.* [Clarification Statement: Emphasis is on the attractive and repulsive forces that determine the functioning of the material. Examples could include why electrically conductive materials are often made of metal, flexible but durable materials are made up of long chained molecules, and pharmaceuticals are designed to interact with specific receptors.] [Assessment Boundary: Assessment is limited to provided molecular structures of specific designed materials.]

PHYSICAL SCIENCE, Concepts in Action: Bulk properties of elements and the influence of those properties on their use are discussed in Section 5.3, Representative Groups, on SE/TE page 139-145. The relationship between the crystal structure of ionic compounds and their use is discussed in Properties of Ionic Compounds, on SE/TE page 164. The relationship between the structure of lattices in metals and bulk properties such as malleability and ductility are discussed in Explaining the Properties of Metals, on SE/TE page 177. The properties of alloys and their use in designed products are discussed in Alloys, on SE/TE pages 178-181. The relationship between the atomic structure of silicon and their use in silicon chips is discussed in Concepts in Action, Chipping In, on SE/TE pages 182-183.

In Section 6.4 Assessment question 3, on SE/TE page 181, students **communicate** how scientists design alloys with specific properties; in question 5, students **explain** why metals are good conductors of electric current; in question 6 on SE/TE page 181, students **communicate** how adding carbon to steel makes the steel harder and stronger. In Writing in Science, on SE/TE page 181, students **write** a paragraph comparing the properties of ionic compounds and alloys. In Going Further, on SE/TE page 183, students **write** about the use of silicon in the development of transistors. In Consumer Lab, Improving the Dyeing of Nonpolar Fabrics, on SE/TE pages 184-185 and Lab pages 293-294, students observe the effect of polar bonds on the ability of a fabric to absorb dye. In Teacher Demo, on TE only page 177, students **observe** the difference in malleability of rock salt and copper wire and **explain** the difference in terms of the molecular structure of the materials.

HS-PS3 Energy

HS-PS3 Energy

Students who demonstrate understanding can:

HS-PS3-1. Create a computational model to calculate the change in the energy of one component in a system when the change in energy of the other component(s) and energy flows in and out of the system are known. [Clarification Statement: Emphasis is on explaining the meaning of mathematical expressions used in the model.] [Assessment Boundary: Assessment is limited to basic algebraic expressions or computations; to systems of two or three components; and to thermal energy, kinetic energy, and/or the energies in gravitational, magnetic, or electric fields.]

PHYSICAL SCIENCE, Concepts in Action: Equations for calculating kinetic and gravitational potential energy are presented in Section 15.1, Energy and Its Forms, on SE/TE pages 447 and 449. Energy conversion and conservation are covered in Section 15.2, Energy Conversion and Conservation, on SE/TE pages 453-459. In Math Skills, on SE/TE page 458, the equations for conservation of mechanical energy are introduced.

In Math Practice, on SE/TE pages 448 and 452, students **calculate** kinetic and potential energies. In Math Practice, on SE/TE page 458 and 459, students **calculate** the change in energy when two of three of variables are known. In Investigation 15B, Determining the Kinetic Energy of a Pendulum, on Lab pages 163-166, students **calculate** the kinetic energy of a pendulum under various conditions.

HS-PS3-2. Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative position of particles (objects). [Clarification Statement: Examples of phenomena at the macroscopic scale could include the conversion of kinetic energy to thermal energy, the energy stored due to position of an object above the earth, and the energy stored between two electrically-charged plates. Examples of models could include diagrams, drawings, descriptions, and computer simulations.]

PHYSICAL SCIENCE, Concepts in Action: Energy as moving particles is presented in Thermal Energy and in Chemical Energy, on SE/TE page 451. Energy as fields is introduced in Electric Fields, on SE/TE page 602 and in Magnetic Fields, on SE/TE pages 631-632.

Students **use models** of particles accounting for energy in Figure 2, on SE/TE page 475. Students **use a model** of electric charges and fields to illustrate static electricity discharge in Figure 6, on SE/TE page 603. In Writing in Science, on SE/TE page 603, students **use a model** of electric fields to explain how a person might receive a shock from a metal door knob on a dry winter day.

HS-PS3-3. Design, build, and refine a device that works within given constraints to convert one form of energy into another form of energy.* [Clarification Statement: Emphasis is on both qualitative and quantitative evaluations of devices. Examples of devices could include Rube Goldberg devices, wind turbines, solar cells, solar ovens, and generators. Examples of constraints could include use of renewable energy forms and efficiency.] [Assessment Boundary: Assessment for quantitative evaluations is limited to total output for a given input. Assessment is limited to devices constructed with materials provided to students.]

PHYSICAL SCIENCE, Concepts in Action: Information about devices that convert one form of energy to another is presented in How It Works, Wind Turbine, on SE/TE page 465; in Concepts in Action, Solar Home, on SE/TE page 484; in Heat Engines on SE/TE pages 486-487; in Electric Motor on SE/TE page 639; and Generators on SE/TE pages 643-644.

Students **build** an electric generator in Application Lab, Investigating an Electric Generator, on SE/TE pages 648-649 and Lab pages 333-334.

HS-PS3-4. Plan and conduct an investigation to provide evidence that the transfer of thermal energy when two components of different temperature are combined within a closed system results in a more uniform energy distribution among the components in the system (second law of thermodynamics). [Clarification Statement: Emphasis is on analyzing data from student investigations and using mathematical thinking to describe the energy changes both quantitatively and conceptually. Examples of investigations could include mixing liquids at different initial temperatures or adding objects at different temperatures to water.] [Assessment Boundary: Assessment is limited to investigations based on materials and tools provided to students.]

PHYSICAL SCIENCE, Concepts in Action: Thermal energy is presented in Section 16.1, Thermal Energy and Matter, on SE/TE pages 474-478.

In Teacher Demo, Calorimetry, on TE only page 478, students **observe** that a cold object placed in warmer water becomes warmer as the water becomes colder.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-PS3-5. Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction. [Clarification Statement: Examples of models could include drawings, diagrams, and texts, such as drawings of what happens when two charges of opposite polarity are near each other, including an explanation of how the change in energy of the objects is related to the change in energy of the field.] [Assessment Boundary: Assessment is limited to systems containing two objects.]

PHYSICAL SCIENCE, Concepts in Action: Energy as fields is introduced in Electric Fields, on SE/TE page 602 and in Magnetic Fields, on SE/TE pages 631-632.

Students **use a model** of electric charges and fields in Figure 4, on SE/TE page 602. Students **use a model** of the effect of charged particles being close together in Figure 5, on SE/TE page 602. Students **use a model** of electric charges and fields to illustrate static electricity discharge in Figure 6, on SE/TE page 603. In Writing in Science, on SE/TE page 603, students **use a model** of electric fields to explain how a person might receive a shock from a metal door knob on a dry winter day. Students **use a model** of magnetic fields to understand their forces in Figure 2 and Figure 3, on SE/TE page 631. Students **use a model** of magnetic and electric fields in How MRI Works, on SE/TE page 641.

**Science and Engineering Practices
Developing and Using Models**

Modeling in 9–12 builds on K–8 and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed worlds.

- Develop and use a model based on evidence to illustrate the relationships between systems or between components of a system. (HS-PS3-2),(HS-PS3-5)

SE/TE:

451 “Thermal Energy and in Chemical Energy”

602 “Electric Fields”

631-632 “Magnetic Fields”

Planning and Carrying Out Investigations

Planning and carrying out investigations to answer questions or test solutions to problems in 9–12 builds on K–8 experiences and progresses to include investigations that provide evidence for and test conceptual, mathematical, physical, and empirical models.

- Plan and conduct an investigation individually and collaboratively to produce data to serve as the basis for evidence, and in the design: decide on types, how much, and accuracy of data needed to produce reliable measurements and consider limitations on the precision of the data (e.g., number of trials, cost, risk, time), and refine the design accordingly. (HS-PS3-4)

SE/TE:

474-475 Section 16.1, Thermal Energy and Matter

Using Mathematics and Computational Thinking

Mathematical and computational thinking at the 9–12 level builds on K–8 and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms, and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.

- Create a computational model or simulation of a phenomenon, designed device, process, or system. (HS-PS3-1)

SE/TE:

446-452 Section 15.1, Energy and Its Forms
453-459 Section 15.2, Energy Conversion and Conservation

Disciplinary Core Ideas

PS3.A: Definitions of Energy

- Energy is a quantitative property of a system that depends on the motion and interactions of matter and radiation within that system. That there is a single quantity called energy is due to the fact that a system's total energy is conserved, even as, within the system, energy is continually transferred from one object to another and between its various possible forms. (HS-PS3-1),(HS-PS3-2)

SE/TE:

446-452 Section 15.1, Energy and Its Forms

453-459 Section 15.2, Energy Conversion and Conservation

451 “Thermal Energy and in Chemical Energy”

602 “Electric Fields”

631-632 “Magnetic Fields”

- At the macroscopic scale, energy manifests itself in multiple ways, such as in motion, sound, light, and thermal energy. (HS-PS3-2) (HS-PS3-3)

SE/TE:

451 “Thermal Energy and in Chemical Energy”

465 How It Works, Wind Turbine

484 Concepts in Action, Solar Home

486-487 “Heat Engines”

602 “Electric Fields”

631-632 “Magnetic Fields”

639 “Electric Motor”

634-635 “Generators”

- These relationships are better understood at the microscopic scale, at which all of the different manifestations of energy can be modeled as a combination of energy associated with the motion of particles and energy associated with the configuration (relative position of the particles). In some cases the relative position energy can be thought of as stored in fields (which mediate interactions between particles). This last concept includes radiation, a phenomenon in which energy stored in fields moves across space. (HS-PS3-2)

SE/TE:

451 “Thermal Energy and in Chemical

Crosscutting Concepts

Cause and Effect

- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system. (HS-PS3-5)

SE/TE:

602 “Electric Fields”

631-632 “Magnetic Fields”

Systems and System Models

- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models. (HS-PS3-4)

SE/TE:

474-475 Section 16.1, Thermal Energy and Matter

- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models. (HS-PS3-1)

SE/TE:

446-452 Section 15.1, Energy and Its Forms

453-459 Section 15.2, Energy Conversion and Conservation

Energy and Matter

- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system. (HS-PS3-3)

HS-PS4 Waves and Their Applications in Technologies for Information Transfer

HS-PS4 Waves and Their Applications in Technologies for Information Transfer

Students who demonstrate understanding can:

HS-PS4-1. Use mathematical representations to support a claim regarding relationships among the frequency, wavelength, and speed of waves traveling in various media. [Clarification Statement: Examples of data could include electromagnetic radiation traveling in a vacuum and glass, sound waves traveling through air and water, and seismic waves traveling through the Earth.] [Assessment Boundary: Assessment is limited to algebraic relationships and describing those relationships qualitatively.]

PHYSICAL SCIENCE, Concepts in Action: Waves are presented in Section 17.1, Mechanical Waves, on SE/TE pages 500-507. Frequency, wavelength, and speed of waves are discussed in Section 17.2, Properties of Mechanical Waves, on SE/TE pages 504-507. Calculation of wave speed is introduced in Math Skills, on SE/TE page 506. Sound waves are described on SE/TE pages 514-515, seismic waves on SE/TE pages 686-687, and electromagnetic waves in Section 18.1, Electromagnetic Waves, on SE/TE pages 532-538.

Students **calculate** speed, wavelength, and frequency in Math Practice, on SE/TE page 506. In Section 17.2 Assessment question 6, on SE/TE page 507, students **relate** a change in frequency the period of the wave. In question 8, students **predict** how the wavelength will change when the frequency of a wave is doubled.

HS-PS4-2. Evaluate questions about the advantages of using a digital transmission and storage of information. [Clarification Statement: Examples of advantages could include that digital information is stable because it can be stored reliably in computer memory, transferred easily, and copied and shared rapidly. Disadvantages could include issues of easy deletion, security, and theft.]

PHYSICAL SCIENCE, Concepts in Action: Personal computers are discussed in Concepts in Action, Getting Personal with Computers, on SE/TE pages 614-617. Analog and digital signals are contrasted in Electronic Signals, on SE/TE pages 618-619. Digital cameras are discussed in How It Works, Digital Camera, on SE/TE page 620. Digital phones are discussed in Communications Technology, on SE/TE page 622.

In Section 20.4 Assessment question 5, on SE/TE page 622, students **explain** how microchips are beneficial for communication devices. In Build Science Skills, Comparing and Contrasting, on TE only page 619, students **compare** analog and digital signals. In For Enrichment, on TE only page 620, students **research** questions about digital cameras and image technology.

HS-PS4-3. Evaluate the claims, evidence, and reasoning behind the idea that electromagnetic radiation can be described either by a wave model or a particle model, and that for some situations one model is more useful than the other.

[Clarification Statement: Emphasis is on how the experimental evidence supports the claim and how a theory is generally modified in light of new evidence. Examples of a phenomenon could include resonance, interference, diffraction, and photoelectric effect.] [Assessment Boundary: Assessment does not include using quantum theory.]

PHYSICAL SCIENCE, Concepts in Action: The particle and wave theories of light are covered in Wave or Particle? on SE/TE pages 536-537.

Students **predict** what would happen in Young's slit interference experiment if light behaved like a stream of particles on TE only page 536. In Reading Checkpoint, on SE/TE page 536, students are prompted to **describe** the evidence that light travels like a wave. In Reading Checkpoint, on SE/TE page 537, students are prompted to **describe** the photoelectric effect, which is evidence for the particle theory of light. In Teacher Demo, The Photoelectric Effect, on TE only page 537, students indirectly **observe** the photoelectric effect.

HS-PS4-4. Evaluate the validity and reliability of claims in published materials of the effects that different frequencies of electromagnetic radiation have when absorbed by matter. [Clarification Statement: Emphasis is on the idea that different frequencies of light have different energies, and the damage to living tissue from electromagnetic radiation depends on the energy of the radiation. Examples of published materials could include trade books, magazines, web resources, videos, and other passages that may reflect bias.] [Assessment Boundary: Assessment is limited to qualitative descriptions.]

PHYSICAL SCIENCE, Concepts in Action: This expectation falls outside of the program scope and sequence. See *Miller & Levine Biology*, ISBN: 978-013-361465-7, Chapter 32.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-PS4-5. Communicate technical information about how some technological devices use the principles of wave behavior and wave interactions with matter to transmit and capture information and energy.* [Clarification Statement: Examples could include solar cells capturing light and converting it to electricity; medical imaging; and communications technology.] [Assessment Boundary: Assessments are limited to qualitative information. Assessments do not include band theory.]

PHYSICAL SCIENCE, Concepts in Action: Solar panels are discussed in Concepts in Action, Solar Home, on SE/TE page 485. Radio, television, and radar are covered in Radio Waves, on SE/TE pages 541-543. Telescopes, cameras, and microscopes are discussed in Section 19.3, Optical Instruments, on SE/TE pages 580-584. Fiber optics are presented in Concepts in Action, Fiber Optics, on SE/TE pages 586-587. Magnetic Resonance Imaging is discussed in Concepts in Action, Peeking Inside the Human Body, on SE/TE pages 640-641. Doppler radar is covered in Doppler Radar on SE/TE pages 774-775.

In Data Analysis, How Long Does an Antenna Need to Be? on SE/TE page 542, students **determine** the relationship between the length of an antenna and the wavelength of a radio transmission. In Writing in Science, "Compare-Contrast Paragraph," on SE/TE page 583, students **write** a comparison of analog and digital cameras. In Quick Lab, Building a Pinhole Viewer, on SE/TE page 585, students **build** a pinhole viewer and **describe** the formation of an inverted image by a pinhole camera. In Going Further on SE/TE page 587, students **research** how fiber optic strands are manufactured and **communicate** their findings to the class. In Build Science, Observe, on TE only page 540, students **observe** and **explain** the variability of radio reception in different locations. In Teacher Demo, Radio Reception, on TE only page 541, students **observe** factors that affect radio signal reception. In Build Science Skills, on TE only page 587, students **observe** the properties of optical fibers.

HS-ESS1 Earth's Place in the Universe

HS-ESS1 Earth's Place in the Universe

Students who demonstrate understanding can:

HS-ESS1-1. Develop a model based on evidence to illustrate the life span of the sun and the role of nuclear fusion in the sun's core to release energy that eventually reaches Earth in the form of radiation. [Clarification Statement: Emphasis is on the energy transfer mechanisms that allow energy from nuclear fusion in the sun's core to reach Earth. Examples of evidence for the model include observations of the masses and lifetimes of other stars, as well as the ways that the sun's radiation varies due to sudden solar flares ("space weather"), the 11-year sunspot cycle, and non-cyclic variations over centuries.] [Assessment Boundary: Assessment does not include details of the atomic and sub-atomic processes involved with the sun's nuclear fusion.]

PHYSICAL SCIENCE, Concepts in Action: The role of nuclear fusion in the sun's core is discussed in Energy From the Sun, on SE/TE pages 832-833. Transfer of energy from the sun's core to the surface of the sun is discussed in The Sun's Interior, on SE/TE pages 834-835 and The Sun's Atmosphere, on SE/TE page 835. The life span of stars, including the sun, is discussed in Section 26.3, Life Cycles of Stars, on SE/TE pages 844-848.

In Figure 2, on SE/TE page 833, students **use a model** of nuclear fusion in the sun's core. In Figure 4, on SE/TE page 834, students **use a model** of the sun's interior. In Section 26.1 Assessment question 1, on SE/TE page 837, students **explain** the source of the sun's energy. In Writing in Science, on SE/TE page 837, students **develop a model** of the sun's interior and **describe** it in a few paragraphs. In Figure 17, on SE/TE pages 846-847, students **use a model** of the life cycle of stars. In Section 26.3 Assessment question 2, on SE/TE page 848, students **describe** the factors that determine the length of a star's life.

HS-ESS1-2. Construct an explanation of the Big Bang theory based on astronomical evidence of light spectra, motion of distant galaxies, and composition of matter in the universe. [Clarification Statement: Emphasis is on the astronomical evidence of the red shift of light from galaxies as an indication that the universe is currently expanding, the cosmic microwave background as the remnant radiation from the Big Bang, and the observed composition of ordinary matter of the universe, primarily found in stars and interstellar gases (from the spectra of electromagnetic radiation from stars), which matches that predicted by the Big Bang theory (3/4 hydrogen and 1/4 helium).]

PHYSICAL SCIENCE, Concepts in Action: The Big Bang Theory is discussed in Section 26.5, The Expanding Universe, on SE/TE pages 856-859.

In Section 26.5 Assessment question 1, on SE/TE page 859, students **construct** an explanation of the expanding universe; in question 2, students **explain** how the universe began according to the Big Bang Theory; in question 3, students **describe** the evidence for the Big Bang Theory, including cosmic microwave background radiation, and the red shift caused by the motion of distant galaxies. In the Quick Lab, Modeling the Expansion of the Universe, on SE/TE page 859, students **explain** why farther galaxies are receding faster, which further supports the Big Bang Theory.

HS-ESS1-3. Communicate scientific ideas about the way stars, over their life cycle, produce elements. [Clarification Statement: Emphasis is on the way nucleosynthesis, and therefore the different elements created, varies as a function of the mass of a star and the stage of its lifetime.] [Assessment Boundary: Details of the many different nucleosynthesis pathways for stars of differing masses are not assessed.]

PHYSICAL SCIENCE, Concepts in Action: Nucleosynthesis is discussed in Facts and Figures, A Changing Sun, on TE only page 834 and in High-Mass Stars, on SE/TE pages 847-848.

In Writing for Science, on SE/TE page 848, students **write** a paragraph to **communicate** scientific ideas explaining the sequence of events that resulted in the creation of the elements in stars.

HS-ESS1-4. Use mathematical or computational representations to predict the motion of orbiting objects in the solar system. [Clarification Statement: Emphasis is on Newtonian gravitational laws governing orbital motions, which apply to human-made satellites as well as planets and moons.] [Assessment Boundary: Mathematical representations for the gravitational attraction of bodies and Kepler's Laws of orbital motions should not deal with more than two bodies, nor involve calculus.]

PHYSICAL SCIENCE, Concepts in Action: Newton's law of universal gravitation is discussed in Gravitational Force, on SE/TE pages 380-382. Kepler's Laws are discussed in Planetary Orbits, on SE/TE page 796.

In Teacher Demo, Planetary Orbits, on TE only page 796, students **observe** the shape of planetary orbits. In Investigation 25B, Exploring Orbits, on Lab pages 267-270, students **calculate** the eccentricity of constructed ellipses and **compare** them to the orbits of the planets and then **compare and contrast** the shapes of the orbits of planets.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-ESS1-5. Evaluate evidence of the past and current movements of continental and oceanic crust and the theory of plate tectonics to explain the ages of crustal rocks. [Clarification Statement: Emphasis is on the ability of plate tectonics to explain the ages of crustal rocks. Examples include evidence of the ages oceanic crust increasing with distance from mid-ocean ridges (a result of plate spreading) and the ages of North American continental crust increasing with distance away from a central ancient core (a result of past plate interactions).]

PHYSICAL SCIENCE, Concepts in Action: Evidence supporting the theory of plate tectonics is presented in Section 22.4, Plate Tectonics, on SE/TE pages 676-683. Evidence of continental crust movement is discussed on SE/TE page 677. Evidence of oceanic crust movement is covered on SE/TE pages 678-679. The methods of dating the age of rocks are discussed in Determining the Age of Rocks, on SE/TE pages 732-734.

In Section 23.6 Assessment question 1, on SE/TE page 738, students **describe** the evidence that geologists use to determine the relative age of rocks. In question 2, students **describe** how the absolute age of rocks is determined.

HS-ESS1-6. Apply scientific reasoning and evidence from ancient Earth materials, meteorites, and other planetary surfaces to construct an account of Earth’s formation and early history. [Clarification Statement: Emphasis is on using available evidence within the solar system to reconstruct the early history of Earth, which formed along with the rest of the solar system 4.6 billion years ago. Examples of evidence include the absolute ages of ancient materials (obtained by radiometric dating of meteorites, moon rocks, and Earth’s oldest minerals), the sizes and compositions of solar system objects, and the impact cratering record of planetary surfaces.]

PHYSICAL SCIENCE, Concepts in Action: Section 23.6, Earth’s History, on SE/TE pages 732-738, discusses the history of Earth and the methods of determining that history. Additional information on the earliest history of Earth is covered in Facts and Figures, Early History, on TE only page 735.

In Section 23.6 Assessment question 3, on SE/TE page 738, students **describe** the evidence that geologists use to develop the geologic time scales. In question 4, students **describe** how the geologic time scale divides Earth’s history.

Science and Engineering Practices

Developing and Using Models

Modeling in 9–12 builds on K–8 experiences and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed world(s).

- Develop a model based on evidence to illustrate the relationships between systems or between components of a system. (HS-ESS1-1)

SE/TE:

832-833 “Energy From the Sun”
834-835 “The Sun’s Interior”
835 “The Sun’s Atmosphere”
844-848 Section 26.3, Life Cycles of Stars

Using Mathematical and Computational Thinking

Mathematical and computational thinking in 9–12 builds on K–8 experiences and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms, and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.

- Use mathematical or computational representations of phenomena to describe explanations. (HS-ESS1-4)

SE/TE:

380-382 “Gravitational Force”
796 “Planetary Orbits”

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles, and theories.

Disciplinary Core Ideas

ESS1.A: The Universe and Its Stars

- The star called the sun is changing and will burn out over a lifespan of approximately 10 billion years. (HS-ESS1-1)

SE/TE:

832-833 “Energy From the Sun”
834-835 “The Sun’s Interior”
835 “The Sun’s Atmosphere”
844-848 Section 26.3, Life Cycles of Stars

- The study of stars’ light spectra and brightness is used to identify compositional elements of stars, their movements, and their distances from Earth. (HS-ESS1-2),(HS-ESS1-3)

SE/TE:

847-848 “High-Mass Stars”
856-859 Section 26.5, The Expanding Universe

TE only:

834 Facts and Figures, A Changing Sun

- The Big Bang theory is supported by observations of distant galaxies receding from our own, of the measured composition of stars and non-stellar gases, and of the maps of spectra of the primordial radiation (cosmic microwave background) that still fills the universe. (HS-ESS1-2)

SE/TE:

856-859 Section 26.5, The Expanding Universe

Crosscutting Concepts

Patterns

- Empirical evidence is needed to identify patterns. (HS-ESS1-5)

SE/TE:

676-683 Section 22.4, Plate Tectonics
732-734 “Determining the Age of Rocks”

Scale, Proportion, and Quantity

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs. (HS-ESS1-1)

SE/TE:

832-833 “Energy From the Sun”
834-835 “The Sun’s Interior”
835 “The Sun’s Atmosphere”
844-848 Section 26.3, Life Cycles of Stars

- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth). (HS-ESS1-4)

SE/TE:

380-382 “Gravitational Force”
796 “Planetary Orbits”

Energy and Matter

- Energy cannot be created or destroyed—only moved between one place and another place, between objects and/or fields, or between systems. (HS-ESS1-2)

HS-ESS2 Earth's Systems

HS-ESS2 Earth's Systems

Students who demonstrate understanding can:

HS-ESS2-1. Develop a model to illustrate how Earth's internal and surface processes operate at different spatial and temporal scales to form continental and ocean-floor features. [Clarification Statement: Emphasis is on how the appearance of land features (such as mountains, valleys, and plateaus) and sea-floor features (such as trenches, ridges, and seamounts) are a result of both constructive forces (such as volcanism, tectonic uplift, and orogeny) and destructive mechanisms (such as weathering, mass wasting, and coastal erosion).] [Assessment Boundary: Assessment does not include memorization of the details of the formation of specific geographic features of Earth's surface.]

PHYSICAL SCIENCE, Concepts in Action: Slow processes that create continental and ocean-floor features are discussed in Section 22.4, Plate Tectonics, on SE/TE pages 676-683. Continental drift is introduced on SE/TE page 677, sea-floor spreading on SE/TE pages 678-679, and mountain building on SE/TE page 683. In Facts and Figures, Early Supercontinents, on TE only page 678, the history of continents is sketched. In Facts and Figures, Pole Reversals, on TE only page 679 the time scale for magnetic pole reversals is described. In Facts and Figures, Tectonics, on TE only page 680, the time scale for convection cells in the mantle is covered. In Facts and Figures, The Formation of the Himalayas, on TE only page 682, an example of mountain building is given. Processes that work at a quicker rate are detailed in Section 23.2, Weathering and Mass Movement, on SE/TE pages 709-712. Erosion is discussed on SE/TE page 709, Weathering on SE/TE pages 710-711, and mass movements on SE/TE page 712. Erosion is also discussed in Section 23.3, Water Shapes the Land, on SE/TE pages 713-717, and in Section 23.4, Glaciers and Wind, on SE/TE pages 719-723. Rapid changes are discussed in Section 22.5, Earthquakes, on SE/TE pages 684-689 and in Section 22.6, Volcanoes, on SE/TE pages 690-696.

Students **use a model** of continental drift in Figure 24, on SE/TE page 677. Students **use a model** of sea-floor spreading in Figure 26, on SE/TE page 678. Students **use a model** of magnetic polarity switching in the ocean crust in Figure 27, on SE/TE page 679. Students **use a model** of plate boundary and plate movements in Figure 30, on SE/TE page 682. In Section 22.4 Assessment questions 1 through 4, on SE/TE page 683, they **explain** the plate tectonic model; in question 5, they **explain** the mountain building mode; in questions 8 and 9, they **apply** the plate tectonic model to **explain** the location of ocean trenches and **predict** the result of two plates converging. In Connection Concepts, on SE/TE page 683, students **relate** the general model of thermal convection currents to a specific model convection cells in the mantle of Earth. Students **use a model** of waves from earthquakes moving through Earth in Figure 37, on SE/TE page 689. In Section 22.5 Assessment question 4, on SE/TE page 689, students **apply** the plate tectonic model to **explain** where earthquakes occur most often. Students **use a model** of a composite volcano in Figure 39, on SE/TE page 691. They **use a model** of plate tectonics to **explain** the distribution of volcanoes in Figure 42, on SE/TE page 693. In Section 22.3 Assessment question 3, on SE/TE page 696, students **use** the plate tectonics model to **explain** the distribution of volcanoes on Earth's surface. In Exploration Lab, Using Earthquakes to Map Plate Boundaries, on SE/TE page 697 and Lab pages 337-338, students **create a model** of the boundary between two plates. Students **use a model** of mass movement in Figure 11, on SE/TE page 712. In Quick Lab, Running Water Erodes the Land, on SE/TE page 714, students **model** deposition by running water. They **use a model** of stream erosion and deposition creating land features in Figure 14, on SE/TE page 715. Students **use a model** of how land features are formed by glacial deposition in How It Works, Glacial Deposition, on SE/TE page 722. Students **use a model** of wind erosion and deposition in Figure 22, on SE/TE page 723. In Exploration Lab, Modeling Erosion, on SE/TE page 739 and Lab page 339-340, students **create a model** of erosion. In Teacher Demo, Convection and Plate Motion, on TE only page 680, students **observe** a model of how convection cells move crustal masses. In Build Science Skills, Using Models, on TE only page 686, they **create** a model of the motion in Earth's crust during an earthquake. In Build Science Skills, Types of Volcanoes, on TE only page 694, students **use** information from models of volcano types to **identify** the type of volcano from which different types of igneous rocks came. In Teacher Demo, Chemical Weathering, on TE only page 710, students **observe** how rock can be broken down by a chemical reaction. In Teacher Demo, Glacial Erosion and Deposition, on TE only page 720, students **observe** a model of how glaciers move boulders and create depositional features. In Investigation 23B, Beach Erosion, on Lab page 247-250, students **create a model** of beach erosion and deposition.

HS-ESS2-2. Analyze geoscience data to make the claim that one change to Earth's surface can create feedbacks that cause changes to other Earth's systems. [Clarification Statement: Examples should include climate feedbacks, such as how an increase in greenhouse gases causes a rise in global temperatures that melts glacial ice, which reduces the amount of sunlight reflected from Earth's surface, increasing surface temperatures and further reducing the amount of ice. Examples could also be taken from other system interactions, such as how the loss of ground vegetation causes an increase in water runoff and soil erosion; how dammed rivers increase groundwater recharge, decrease sediment transport, and increase coastal erosion; or how the loss of wetlands causes a decrease in local humidity that further reduces the wetland extent.]

PHYSICAL SCIENCE, Concepts in Action: Changes in Earth systems that cause feedback changes in other Earth systems is discussed in Section 24.7, Climate, on SE/TE pages 778-786. Long-term changes, such as mountain building causing a rain shadow which, in turn, creates a desert climate are covered in Factor Affecting Precipitation, on SE/TE page 780. Very long-term changes caused by the movement of tectonic plates are discussed in Plate Tectonics, on SE/TE page 782. The connection between ice ages and the orbit of Earth around the sun is discussed in Earth's Position Relative to the Sun, on SE/TE page 782. Short-term changes in ocean currents and conditions that occur during an El Niño or La Niña event, and effect the amount of precipitation, are presented in Ocean Circulation, on SE/TE page 783.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

The cooling effect caused by large volcanic eruptions is discussed in Volcanic Activity, on SE/TE page 783. The increase in global air temperature due to increases in man-made greenhouse gases is discussed in Human Activities and Climate Change, on SE/TE pages 784-785.

In Data Analysis, Tracking Climate Change, on SE/TE page 783, students **analyze** climate data to **track** the effects of El Niño events and the eruption of Mount Pinatubo. Students **analyze** data of Atmospheric Carbon Dioxide, 1000-2010, in Figure 38, on SE/TE page 784. In For Enrichment, Natural Climate Change, on TE only page 782, students research the different ways in which plate tectonics alters Earth's climates and the resulting consequences for life on Earth. In Teacher Demo, Earth's Motions and Climate, on TE only page 782, students **observe** how changes in Earth's motions affect Earth's climate. In Investigation 24B, Modeling Global Warming, On Lab pages 257-260, students **analyze** data from a simulation of the greenhouse effects of carbon dioxide in the atmosphere.

HS-ESS2-3. Develop a model based on evidence of Earth's interior to describe the cycling of matter by thermal convection.

[Clarification Statement: Emphasis is on both a one-dimensional model of Earth, with radial layers determined by density, and a three-dimensional model, which is controlled by mantle convection and the resulting plate tectonics. Examples of evidence include maps of Earth's three-dimensional structure obtained from seismic waves, records of the rate of change of Earth's magnetic field (as constraints on convection in the outer core), and identification of the composition of Earth's layers from high-pressure laboratory experiments.]

PHYSICAL SCIENCE, Concepts in Action: The structure of Earth's interior is presented in a Cross Section of Earth, on SE/TE pages 661-663. Cycling of matter by thermal convection is covered in The Theory of Plate Tectonics, on SE/TE pages 679-680. In Facts and Figures, Tectonics, on TE only page 680, the cycling of oceanic lithosphere within the mantle is discussed. Smaller scale cycling of matter by convection is discussed in Formation of a Volcano, on SE/TE page 691.

In Connection Concepts, on SE/TE page 683, students **relate** the general model of thermal convection currents to **develop a model** of convection cells in the mantle of Earth. In Teacher Demo, Convection and Plate Motion, on TE only page 680, students **observe a model** of how convection cells move crustal masses by thermal convection.

HS-ESS2-4. Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.

[Clarification Statement: Examples of the causes of climate change differ by timescale, over 1-10 years: large volcanic eruption, ocean circulation; 10-100s of years: changes in human activity, ocean circulation, solar output; 10-100s of thousands of years: changes to Earth's orbit and the orientation of its axis; and 10-100s of millions of years: long-term changes in atmospheric composition.] [Assessment Boundary: Assessment of the results of changes in climate is limited to changes in surface temperatures, precipitation patterns, glacial ice volumes, sea levels, and biosphere distribution.]

PHYSICAL SCIENCE, Concepts in Action: Climate change is introduced in Section 24.7, Climate, on SE/TE pages 778-786. Natural Climate change is discussed on SE/TE pages 782-783. Topics covered include changes due to continental drift, due to the relative position of Earth to the sun, solar activity, and changes in ocean circulation and volcanic activity. Human activities and climate change are discussed on SE/TE pages 784-786. Topics covered include the effects of raising livestock, the use of fire, and the effects of increased emissions of greenhouse gases.

Students **use a model** of Earth's orbit in relation to the sun in Figure 37, on SE/TE page 782. Students **analyze** data of Atmospheric Carbon Dioxide, 1000-2010, in Figure 38 on SE/TE page 784. In For Enrichment, Natural Climate Change, on TE only page 782, students **research** the different ways in which plate tectonics alter Earth's climates and the resulting consequences for life on Earth. In Teacher Demo, Earth's Motions and Climate, on TE only page 782, students **observe** how changes in Earth's motions affect Earth's climate. In Investigation 24B, Modeling Global Warming, On Lab pages 257-260, students **analyze** data from a simulation of the greenhouse effects of carbon dioxide in the atmosphere.

HS-ESS2-5. Plan and conduct an investigation of the properties of water and its effects on Earth materials and surface processes.

[Clarification Statement: Emphasis is on mechanical and chemical investigations with water and a variety of solid materials to provide the evidence for connections between the hydrologic cycle and system interactions commonly known as the rock cycle. Examples of mechanical investigations include stream transportation and deposition using a stream table, erosion using variations in soil moisture content, or frost wedging by the expansion of water as it freezes. Examples of chemical investigations include chemical weathering and recrystallization (by testing the solubility of different materials) or melt generation (by examining how water lowers the melting temperature of most solids).]

PHYSICAL SCIENCE, Concepts in Action: Water at the surface of Earth is discussed in Section 23.1, Fresh Water, on SE/TE pages 704-708. The effects of water on Earth's surface are discussed in Section 23.3 Water Shapes the Land, on SE/TE pages 713-717. The effect of glaciers on Earth's surface is discussed in Glacial Erosion and Deposition, on SE/TE pages 720-721 and How It Works, Glacial Deposition, on SE/TE page 722.

Students **investigate** the water cycle in Quick Lab, Modeling the Water Cycle, on SE/TE page 705. Students **investigate** erosion and deposition in streams in Quick Lab, Forming Sedimentary Layers, on SE/TE page 714. Students **investigate** water sheds in Build Science Skills, Using Models, on TE only page 706. In Teacher Demo, Glacial Erosion and Deposition, on TE only page 720, students **observe** a model of how glaciers move boulders and create depositional features. In Investigation 23B, Beach Erosion, on Lab pages 247-250, students **create a model** of beach erosion and deposition.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

HS-ESS2-6. Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere. [Clarification Statement: Emphasis is on modeling biogeochemical cycles that include the cycling of carbon through the ocean, atmosphere, soil, and biosphere (including humans), providing the foundation for living organisms.]

PHYSICAL SCIENCE, Concepts in Action: The chemistry of carbon atoms and molecules is introduced in Chapter 9, Carbon Chemistry. In Section 9.1, Carbon Compounds, on SE/TE pages 262-269, the various forms of carbon and some of their uses are described. In Section 9.2, Substituted Hydrocarbons, on SE/TE pages 272-274 and Section 9.3, Polymers, on SE/TE pages 275-280, more forms of carbon, including organic compounds, are discussed. In Section 9.4, Reactions in Cells, on SE/TE pages 282-284, photosynthesis and cellular respiration reactions are described.

HS-ESS2-7. Construct an argument based on evidence about the simultaneous coevolution of Earth's systems and life on Earth. [Clarification Statement: Emphasis is on the dynamic causes, effects, and feedbacks between the biosphere and Earth's other systems, whereby geoscience factors control the evolution of life, which in turn continuously alters Earth's surface. Examples of include how photosynthetic life altered the atmosphere through the production of oxygen, which in turn increased weathering rates and allowed for the evolution of animal life; how microbial life on land increased the formation of soil, which in turn allowed for the evolution of land plants; or how the evolution of corals created reefs that altered patterns of erosion and deposition along coastlines and provided habitats for the evolution of new life forms.] [Assessment Boundary: Assessment does not include a comprehensive understanding of the mechanisms of how the biosphere interacts with all of Earth's other systems.]

PHYSICAL SCIENCE, Concepts in Action: The history of life on Earth and geologic time periods are presented in A Brief History of Earth, on SE/TE pages 734-738.

**Science and Engineering Practices
Developing and Using Models**

Modeling in 9–12 builds on K–8 experiences and progresses to using, synthesizing, and developing models to predict and show relationships among variables between systems and their components in the natural and designed world(s).

- Develop a model based on evidence to illustrate the relationships between systems or between components of a system. (HS-ESS2-1),(HS-ESS2-3),(HS-ESS2-6)

SE/TE:

262-269 Section 9.1, Carbon Compounds

272-274 Section 9.2, Substituted Hydrocarbons

275-280 Section 9.3, Polymers

282-284 Section 9.4, Reactions in Cells

661-663 "Cross Section of Earth"

676-683 Section 22.4, Plate Tectonics

684-689 Section 22.5, Earthquakes

690-696 in Section 22.6, Volcanoes

709-712 Section 23.2, Weathering and Mass Movement

713-717 Section 23.3, Water Shapes the Land

719-723 Section 23.4, Glaciers and Wind

TE only

679 Facts and Figures, Pole Reversals

680 Facts and Figures, Tectonics

682 Facts and Figures, The Formation of the Himalayas

- Use a model to provide mechanistic accounts of phenomena. (HS-ESS2-3)

SE/TE:

661-663 "Cross Section of Earth"

679-680 "The Theory of Plate Tectonics"

691 "Formation of a Volcano"

Disciplinary Core Ideas

ESS1.B: Earth and the Solar System

- Cyclical changes in the shape of Earth's orbit around the sun, together with changes in the tilt of the planet's axis of rotation, both occurring over hundreds of thousands of years, have altered the intensity and distribution of sunlight falling on the earth. These phenomena cause a cycle of ice ages and other gradual climate changes. (secondary to HS-ESS2-4)

SE/TE:

778-786 Section 24.7, Climate

ESS2.A: Earth Materials and Systems

- Earth's systems, being dynamic and interacting, cause feedback effects that can increase or decrease the original changes. (HS-ESS2-1),(HS-ESS2-2)

SE/TE:

676-683 Section 22.4, Plate Tectonics

684-689 Section 22.5, Earthquakes

690-696 in Section 22.6, Volcanoes

709-712 Section 23.2, Weathering and Mass Movement

713-717 Section 23.3, Water Shapes the Land

719-723 Section 23.4, Glaciers and Wind

778-786 Section 24.7, Climate

TE only

679 Facts and Figures, Pole Reversals

680 Facts and Figures, Tectonics

682 Facts and Figures, The Formation of the Himalayas

Crosscutting Concepts

Cause and Effect

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects. (HS-ESS2-4)

SE/TE:

778-786 Section 24.7, Climate

Energy and Matter

- The total amount of energy and matter in closed systems is conserved. (HS-ESS2-6)

SE/TE:

262-269 Section 9.1, Carbon Compounds

272-274 Section 9.2, Substituted

Hydrocarbons

275-280 Section 9.3, Polymers

282-284 Section 9.4, Reactions in Cells

- Energy drives the cycling of matter within and between systems. (HS-ESS2-3)

SE/TE:

661-663 "Cross Section of Earth"

679-680 "The Theory of Plate Tectonics"

691 "Formation of a Volcano"

TE only:

680 Facts and Figures, Tectonics

Structure and Function

- The functions and properties of natural and designed objects and systems can be inferred from their overall structure, the way their components are shaped and used, and the molecular substructures of its various materials. (HS-ESS2-5)

SE/TE:

704-708 Section 23.1, Fresh Water

713-717 Section 23.3 Water Shapes the Land

HS-ESS3 Earth and Human Activity

HS-ESS3 Earth and Human Activity

Students who demonstrate understanding can:

HS-ESS3-1. Construct an explanation based on evidence for how the availability of natural resources, occurrence of natural hazards, and changes in climate have influenced human activity. [Clarification Statement: Examples of key natural resources include access to fresh water (such as rivers, lakes, and groundwater), regions of fertile soils such as river deltas, and high concentrations of minerals and fossil fuels. Examples of natural hazards can be from interior processes (such as volcanic eruptions and earthquakes), surface processes (such as tsunamis, mass wasting and soil erosion), and severe weather (such as hurricanes, floods, and droughts). Examples of the results of changes in climate that can affect populations or drive mass migrations include changes to sea level, regional patterns of temperature and precipitation, and the types of crops and livestock that can be raised.]

PHYSICAL SCIENCE, Concepts in Action: In Section 15.3, Energy Resources, students **learn** about nonrenewable and renewable energy resources. Human Activities and Climate Change is covered in Chapter 24, “Weather and Climate” on SE/TE pages 784-786.

In “Conserving Energy Resources,” SE/TE page 466, students **gain understanding** of energy conservation. In Figure 19, students **explain** how mass transportation saves energy. In Writing in Science, students **write** a proposal **explaining** how to avoid future shortages of electricity. Students **obtain knowledge** of human activity influenced by climate changes in “Limiting Global Warming: on SE/TE page 786. In Assessment: Connecting Concepts, students choose an energy resource and **explain** how its use would reduce global warming.

HS-ESS3-2. Evaluate competing design solutions for developing, managing, and utilizing energy and mineral resources based on cost-benefit ratios.* [Clarification Statement: Emphasis is on the conservation, recycling, and reuse of resources (such as minerals and metals) where possible, and on minimizing impacts where it is not. Examples include developing best practices for agricultural soil use, mining (for coal, tar sands, and oil shales), and pumping (for petroleum and natural gas). Science knowledge indicates what can happen in natural systems—not what should happen.]

PHYSICAL SCIENCE, Concepts in Action: Nonrenewable and renewable energy resources are contrasted in Section 15.3, Energy Resources, on SE/TE pages 462-466.

In Writing in Science, on SE/TE page 466, students **propose** ways to help avoid future shortages of electricity in a city.

HS-ESS3-3. Create a computational simulation to illustrate the relationships among management of natural resources, the sustainability of human populations, and biodiversity. [Clarification Statement: Examples of factors that affect the management of natural resources include costs of resource extraction and waste management, per-capita consumption, and the development of new technologies. Examples of factors that affect human sustainability include agricultural efficiency, levels of conservation, and urban planning.] [Assessment Boundary: Assessment for computational simulations is limited to using provided multi-parameter programs or constructing simplified spreadsheet calculations.]

PHYSICAL SCIENCE, Concepts in Action: The relationships among management of natural resources, the sustainability of human populations, and biodiversity falls outside of the program scope and sequence. See *Miller & Levine Biology*, ISBN: 978-013-361465-7, Chapter 2.

HS-ESS3-4. Evaluate or refine a technological solution that reduces impacts of human activities on natural systems.* [Clarification Statement: Examples of data on the impacts of human activities could include the quantities and types of pollutants released, changes to biomass and species diversity, or areal changes in land surface use (such as for urban development, agriculture and livestock, or surface mining). Examples for limiting future impacts could range from local efforts (such as reducing, reusing, and recycling resources) to large-scale geoengineering design solutions (such as altering global temperatures by making large changes to the atmosphere or ocean).]

PHYSICAL SCIENCE, Concepts in Action: The relationships among management of natural resources, the sustainability of human populations, and biodiversity falls outside of the program scope and sequence. See *Miller & Levine Biology*, ISBN: 978-013-361465-7, Chapter 6.

HS-ESS3-5. Analyze geoscience data and the results from global climate models to make an evidence-based forecast of the current rate of global or regional climate change and associated future impacts to Earth systems. [Clarification Statement: Examples of evidence, for both data and climate model outputs, are for climate changes (such as precipitation and temperature) and their associated impacts (such as on sea level, glacial ice volumes, or atmosphere and ocean composition).] [Assessment Boundary: Assessment is limited to one example of a climate change and its associated impacts.]

PHYSICAL SCIENCE, Concepts in Action: Climate change is introduced in Section 24.7, Climate, on SE/TE pages 778-786. Natural climate change is discussed on SE/TE pages 782-783. Topics covered include changes due to continental drift due to the relative position of Earth to the sun, solar activity, and changes in ocean circulation and volcanic activity. Human activities and climate change are discussed on SE/TE pages 784-786. Topics covered include the effects of raising livestock, the use of fire, and the effects of increased emissions of greenhouse gases.

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

Students **analyze** data of Atmospheric Carbon Dioxide, Years 1000-2010, in Figure 38, on SE/TE page 784. In Investigation 24B, Modeling Global Warming, on Lab pages 257-260, students **analyze** data from a simulation of the greenhouse effects of carbon dioxide in the atmosphere.

HS-ESS3-6. Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity. [Clarification Statement: Examples of Earth systems to be considered are the hydrosphere, atmosphere, cryosphere, geosphere, and/or biosphere. An example of the far-reaching impacts from a human activity is how an increase in atmospheric carbon dioxide results in an increase in photosynthetic biomass on land and an increase in ocean acidification, with resulting impacts on sea organism health and marine populations.] [Assessment Boundary: Assessment does not include running computational representations but is limited to using the published results of scientific computational models.]

PHYSICAL SCIENCE, Concepts in Action: Climate change is introduced in Section 24.7, Climate, on SE/TE pages 778-786. Human activities and climate change are discussed on SE/TE pages 784-786. Topics covered include the effects of raising livestock, the use of fire, and the effects of increased emissions of greenhouse gases.

Students **analyze** data of Atmospheric Carbon Dioxide, Years 1000-2010, in Figure 38, on SE/TE page 784. In Investigation 24B, Modeling Global Warming, on Lab pages 257-260, students **analyze** data from a simulation of the greenhouse effects of carbon dioxide in the atmosphere.

Science and Engineering Practices

Analyzing and Interpreting Data

Analyzing data in 9–12 builds on K–8 experiences and progresses to introducing more detailed statistical analysis, the comparison of data sets for consistency, and the use of models to generate and analyze data.

- Analyze data using computational models in order to make valid and reliable scientific claims. (HS-ESS3-5)

SE/TE:
778-786 Section 24.7, Climate

Using Mathematics and Computational Thinking

Mathematical and computational thinking in 9-12 builds on K-8 experiences and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms, and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.

- Create a computational model or simulation of a phenomenon, designed device, process, or system. (HS-ESS3-3)

SE/TE:
462-466 Section 15.3, Energy Resources

- Use a computational representation of phenomena or design solutions to describe and/or support claims and/or explanations. (HS-ESS3-6)

SE/TE:
778-786 Section 24.7, Climate
466 Writing in Science

Constructing Explanations and Designing Solutions

Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific knowledge, principles, and theories.

Disciplinary Core Ideas

ESS2.D: Weather and Climate

- Current models predict that, although future regional climate changes will be complex and varied, average global temperatures will continue to rise. The outcomes predicted by global climate models strongly depend on the amounts of human-generated greenhouse gases added to the atmosphere each year and by the ways in which these gases are absorbed by the ocean and biosphere. (secondary to HS-ESS3-6)

SE/TE:
778-786 Section 24.7, Climate

ESS3.A: Natural Resources

- Resource availability has guided the development of human society. (HS-ESS3-1)

SE/TE:
466 Conserving Energy Resources

- All forms of energy production and other resource extraction have associated economic, social, environmental, and geopolitical costs and risks as well as benefits. New technologies and social regulations can change the balance of these factors. (HS-ESS3-2)

SE/TE:
462-466 Section 15.3, Energy Resources

ESS3.B: Natural Hazards

- Natural hazards and other geologic events have shaped the course of human history; [they] have significantly altered the sizes of human populations and have driven human migrations. (HS-ESS3-1)

ESS3.C: Human Impacts on Earth Systems

- The sustainability of human societies and the biodiversity that supports them requires responsible management of natural resources. (HS-ESS3-3)

SE/TE:
462-466 Section 15.3, Energy Resources

Crosscutting Concepts

Cause and Effect

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects. (HS-ESS3-1)

786 Connecting Concepts

Systems and System Models

- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models. (HS-ESS3-6)

SE/TE:
778-786 Section 24.7, Climate

Stability and Change

- Change and rates of change can be quantified and modeled over very short or very long periods of time. Some system changes are irreversible. (HS-ESS3-3),(HS-ESS3-5)

SE/TE:
462 Nonrenewable Energy Resources
778-786 Section 24.7, Climate

- Feedback (negative or positive) can stabilize or destabilize a system. (HS-ESS3-4)

**Connections to Engineering, Technology, and Applications of Science
Influence of Engineering, Technology, and Science on Society and the Natural World**

- Modern civilization depends on major technological systems. (HS-ESS3-1),(HS-ESS3-3)

SE/TE:
462-466 Section 15.3, Energy Resources

**A Correlation of
Physical Science: Concepts in Action, with Earth and Space Science, ©2011

HS-ETS1 Engineering Design

HS-ETS1 Engineering Design

Students who demonstrate understanding can:

HS-ETS1-1. Analyze a major global challenge to specify qualitative and quantitative criteria and constraints for solutions that account for societal needs and wants.

PHYSICAL SCIENCE, Concepts in Action: In Issues in Science, Genetically Modified Organisms, on SE/TE page 281, students **analyze** problems associated with genetically modified food. In Issues in Science, Are Regulations Needed to Protect Whales from Noise Pollution? on SE/TE page 513, they **analyze** the challenge posed by noise pollution in the oceans. In Issues in Science, Human Impact on the Environment, on SE/TE page 718, students **analyze** problems associated with human uses of natural resources.

HS-ETS1-2. Design a solution to a complex real-world problem by breaking it down into smaller, more manageable problems that can be solved through engineering.

PHYSICAL SCIENCE, Concepts in Action: A solution to the complex real-world problem of water purification, in which the solution is broken down into numerous smaller parts, is discussed in Concepts in Action, Getting a Fresh Start, on SE/TE pages 52-53. A solution to the complex problem of air pollution, in which the solution is broken down into numerous smaller parts, is discussed in Concepts in Action, Breathing Easier, on SE/TE pages 270-271. A solution to the complex real-world problem of airplane flight controls is presented in Concepts in Action, Airplane Motion, on SE/TE pages 398-399.

In Problem-Solving Activity, Transmitting Electricity to a new School, on SE/TE page 646, students **design** a method of transmitting energy from a power plant to a school.

HS-ETS1-3. Evaluate a solution to a complex real-world problem based on prioritized criteria and trade-offs that account for a range of constraints, including cost, safety, reliability, and aesthetics, as well as possible social, cultural, and environmental impacts.

PHYSICAL SCIENCE, Concepts in Action: In Issues in Science, What Should Be Done With Arsenic-Treated Wood? on SE/TE page 59, students **evaluate** different plans for disposing arsenic contaminated wood. In Data Analysis, What Is the Real Cost of a Washing Machine? on SE/TE page 491, students **evaluate** the costs of running washing machines in homes.

HS-ETS1-4. Use a computer simulation to model the impact of proposed solutions to a complex real-world problem with numerous criteria and constraints on interactions within and between systems relevant to the problem.

PHYSICAL SCIENCE, Concepts in Action: Computer simulations fall outside of the program scope and sequence. Students **evaluate** different plans for disposing arsenic contaminated wood in Issues in Science, What Should Be Done With Arsenic-Treated Wood? on SE/TE page 59. In Data Analysis, What Is the Real Cost of a Washing Machine? on SE/TE page 491, students **evaluate** the costs of running washing machines in homes.

Science and Engineering Practices Asking Questions and Defining Problems

Asking questions and defining problems in 9–12 builds on K–8 experiences and progresses to formulating, refining, and evaluating empirically testable questions and design problems using models and simulations.

- Analyze complex real-world problems by specifying criteria and constraints for successful solutions. (HS-ETS1-1)

281 Issues in Science, Genetically Modified Organisms
513 Issues in Science, Are Regulations Needed to Protect Whales from Noise Pollution?
646 Problem-Solving Activity

Disciplinary Core Ideas

ETS1.A: Defining and Delimiting Engineering Problems

- Criteria and constraints also include satisfying any requirements set by society, such as taking issues of risk mitigation into account, and they should be quantified to the extent possible and stated in such a way that one can tell if a given design meets them. (HS-ETS1-1)

SE/TE:

281 Issues in Science, Genetically Modified Organisms
513 Issues in Science, Are Regulations Needed to Protect Whales from Noise Pollution?
718 Issues in Science, Human Impact on the

Crosscutting Concepts Systems and System Models

- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows— within and between systems at different scales. (HS-ETS1-4)

Connections to Engineering, Technology, and Applications of Science

Influence of Science, Engineering, and Technology on Society and the Natural World

- New technologies can have deep impacts on society and the environment, including some that were not anticipated. Analysis of costs and benefits is a critical aspect of decisions about technology. (HS-ETS1-1) (HS-ETS1-3)

Physical Science: Concepts in Action, with Earth and Space Science, ©2011
to the Next Generation Science Standards, May 2013
Grades 9-12**

<p>718 Issues in Science, Human Impact on the Environment</p> <p>Using Mathematics and Computational Thinking Mathematical and computational thinking in 9-12 builds on K-8 experiences and progresses to using algebraic thinking and analysis, a range of linear and nonlinear functions including trigonometric functions, exponentials and logarithms, and computational tools for statistical analysis to analyze, represent, and model data. Simple computational simulations are created and used based on mathematical models of basic assumptions.</p> <ul style="list-style-type: none"> • Use mathematical models and/or computer simulations to predict the effects of a design solution on systems and/or the interactions between systems. (HS-ETS1-4) <p>Constructing Explanations and Designing Solutions Constructing explanations and designing solutions in 9-12 builds on K-8 experiences and progresses to explanations and designs that are supported by multiple and independent student-generated sources of evidence consistent with scientific ideas, principles and theories.</p> <ul style="list-style-type: none"> • Design a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations. (HS-ETS1-2) <p>SE/TE: 52-53 Concepts in Action, Getting a Fresh Start 270-271 Concepts in Action, Breathing Easier 398-399 Concepts in Action, Airplane Motion 646 Problem-Solving Activity</p> <ul style="list-style-type: none"> • Evaluate a solution to a complex real-world problem, based on scientific knowledge, student-generated sources of evidence, prioritized criteria, and tradeoff considerations. (HS-ETS1-3) <p>SE/TE: 59 Issues in Science, What Should Be Done With Arsenic-Treated Wood? 491 Data Analysis, What Is the Real Cost of a Washing Machine?</p>	<p>Environment</p> <ul style="list-style-type: none"> • Humanity faces major global challenges today, such as the need for supplies of clean water and food or for energy sources that minimize pollution, which can be addressed through engineering. These global challenges also may have manifestations in local communities. (HS-ETS1-1) <p>SE/TE: 281 Issues in Science, Genetically Modified Organisms 513 Issues in Science, Are Regulations Needed to Protect Whales from Noise Pollution? 646 Problem-Solving Activity 718 Issues in Science, Human Impact on the Environment</p> <p>ETS1.B: Developing Possible Solutions</p> <ul style="list-style-type: none"> • When evaluating solutions, it is important to take into account a range of constraints, including cost, safety, reliability, and aesthetics, and to consider social, cultural, and environmental impacts. (HS-ETS1-3) <p>SE/TE: 59 Issues in Science, What Should Be Done With Arsenic-Treated Wood? 491 Data Analysis, What is the real Cost of a Washing Machine?</p> <ul style="list-style-type: none"> • Both physical models and computers can be used in various ways to aid in the engineering design process. Computers are useful for a variety of purposes, such as running simulations to test different ways of solving a problem or to see which one is most efficient or economical; and in making a persuasive presentation to a client about how a given design will meet his or her needs. (HS-ETS1-4) <p>ETS1.C: Optimizing the Design Solution</p> <ul style="list-style-type: none"> • Criteria may need to be broken down into simpler ones that can be approached systematically, and decisions about the priority of certain criteria over others (trade-offs) may be needed. (HS-ETS1-2) <p>SE/TE: 52-53 Concepts in Action, Getting a Fresh Start 270-271 Concepts in Action, Breathing Easier 398-399 Concepts in Action, Airplane Motion</p>	<p>SE/TE: 59 Issues in Science, What Should Be Done With Arsenic-Treated Wood? 281 Issues in Science, Genetically Modified Organisms 491 Data Analysis, What is the real Cost of a Washing Machine? 513 Issues in Science, Are Regulations Needed to Protect Whales from Noise Pollution? 718 Issues in Science, Human Impact on the Environment</p>
