Numbers and Quantities	
N.RN The Real Number System	
Extend the properties of exponents to rational exponents.	
N.RN.1 Explain how the definition of the meaning of rational exponents follows from extending the properties of integer exponents to those values, allowing for a notation for radicals in terms of rational exponents. <i>For example, we define $5^{1/3}$ to be the cube root of 5 because we want $(5^{1/3})^3 = 5(1/3)^3$ to hold, so $(5^{1/3})^3$ must equal 5.</i>	Algebra 1 SE/TE: 217, 221, 222-223 Algebra 2 SE/TE: 240, 241, 244, 249, 252, 245-246, 253-254

Use properties of rational and irrational numbers.	
N.RN.3 Explain why the sum or product of two rational numbers is rational; that the sum of a rational number and an irrational number is irrational; and that the product of a nonzero rational number and an irrational number is irrational.	Algebra 1 SE/TE: 6, 7, 8, 9-10
N.Q Quantities

S.CP Conditional Probability and the Rules of Probability	
Understand independence and conditional probability and use them to interpret data	
S.CP.1 Describe events as subsets of a sample space (the set of outcomes) using characteristics (or categories) of the outcomes, or as unions, intersections, or complements of other events ("or," "and," "not"). ★	Geometry SE/TE: 499-506, 514 Algebra 2 SE/TE: 551-557, 558-564, 605-612
S.CP.2 Understand that two events <i>A</i> and <i>B</i> are independent if and only if the probability of <i>A</i> and <i>B</i> occurring together is the product of their probabilities, and use this characterization to determine if they are independent. ★	Geometry SE/TE: 501-502, 503, 504, 505-506, 508, 511, 512-513 Algebra 2 SE/TE: 607-608, 610-612
S.CP.3 Understand the conditional probability of <i>A</i> given <i>B</i> as $P(A \text{ and } B)/P(B)$, and interpret independence of <i>A</i> and <i>B</i> as saying that the conditional probability of <i>A</i> given <i>B</i> is the same as the probability of <i>A</i> , and the conditional probability of <i>B</i> given <i>A</i> is the same as the probability of <i>B</i> . ★	Geometry SE/TE: 508, 509, 510, 511, 512-513 Algebra 2 SE/TE: 613-614, 615, 616, 617, 618-619

<p>S.CP.4 Construct and interpret two-way frequency tables of data when two categories are associated with each object being classified. Use the two-way table as a sample space to decide if events are independent and to approximate conditional probabilities. <i>For example, collect data from a random sample of students in your school on their favorite subject among math, science, and English. Estimate the probability that a randomly selected student from your school will favor science given that the student is in tenth grade. Do the same for other subjects and compare the results.</i> ★</p>	<p>Algebra 1 SE/TE: 495, 498, 499-500</p> <p>Geometry SE/TE: 508, 510</p> <p>Algebra 2 SE/TE: 614, 616, 618-619</p>
<p>S.CP.5 Recognize and explain the concepts of conditional probability and independence in everyday language and everyday situations. <i>For example, compare the chance of having lung cancer if you are a smoker with the chance of being a smoker if you have lung cancer.</i> ★</p>	<p>Geometry SE/TE: 511, 512-513</p> <p>Algebra 2 SE/TE: 613</p>
Use the rules of probability to compute probabilities of compound events in a uniform probability model	
<p>S.CP.6 Find the conditional probability of A given B as the fraction of B's outcomes that also belong to A, and interpret the answer in terms of the model. ★</p>	<p>Geometry SE/TE: 509, 510, 511, 512-513</p> <p>Algebra 2 SE/TE: 613, 614-615, 616, 617, 618-619</p>
<p>S.CP.7 Apply the Addition Rule, $P(A \text{ or } B) = P(A) + P(B) - P(A \text{ and } B)$, and interpret the answer in terms of the model. ★</p>	<p>Algebra 2 SE/TE: 605, 606-607, 611-612</p>
<p>S.CP.8(+) Apply the general Multiplication Rule in a uniform probability model, $P(A \text{ and } B) = P(A)(B A) = P(A) \cdot P(B A) = P(B) \cdot P(A B)$, and interpret the answer in terms of the model. ★</p>	<p>enVision A G A is designed to meet standards that address the first three years of a student's high school career. This standard is intended to address a student's career and college readiness in a 4th year course such as Precalculus.</p>

S.MD Using Probability to Make Decisions	
Calculate expected values and use them to solve problems	
S.MD.1(+) Define a random variable for a quantity of interest by assigning a numerical value to each event in a sample space; graph the corresponding probability distribution using the same graphical displays as for data distributions. ★	Geometry SE/TE: 524-525, 527-529 Algebra 2 SE/TE: 628-635
S.MD.2(+) Calculate the expected value of a random variable; interpret it as the mean of the probability distribution. ★	Geometry SE/TE: 530-536 Algebra 2 SE/TE: 636-642
S.MD.3(+) Develop a probability distribution for a random variable defined for a sample space in which theoretical probabilities can be calculated; find the expected value. <i>For example, find the theoretical probability distribution for the number of correct answers obtained by guessing on all five questions of a multiple-choice test where each question has four choices, and find the expected grade under various grading schemes.</i> ★	Geometry SE/TE: 522-523, 535-536 Algebra 2 SE/TE: 628-635, 641-642
S.MD.4(+) Develop a probability distribution for a random variable defined for a sample space in which probabilities are assigned empirically; find the expected value. <i>For example, find a current data distribution on the number of TV sets per household in the United States, and calculate the expected number of sets per household. How many TV sets would you expect to find in 100 randomly selected households?</i> ★	Geometry SE/TE: 527-529, 530-531, 534-536 Algebra 2 SE/TE: 630-631, 641-642
